# Sprint 3 Burndown Chart

Project Green Bean Sprint 3 Burn Down

From this sprint, our story points cover large tasks such as events that cover multiple aspects when designing and building the code. During the first week, we were able to complete current and past bookings. There are a lot of story points being completed on the last day because each person has been assigned story points, so as the overall story point is completed on the last day, they were being designed, built and tested before being merged to the main. This planned sprint velocity is more linear compared to the previous sprint velocity as a lot of tasks were completed on the last few days. Our velocity did not change much from the previous sprint, but a lot of the stories were started earlier and worked on throughout the weeks and fully completed on the last few days. This is an improvement from last sprint where stories were started closer to the end of the sprint.
